Define a problem statement

Optimizing Spam Filtering With machine Learning

PROBLEM

1. Scammers send fake text messages to trick you into giving them your personal information — things like your password, account number, or Social Security number. If they get that information, they could gain access to your email, bank, or other accounts.

2. Spam filters need to be both accurate and fast. If a filter is too slow, it can cause delays in email delivery, which can be problematic for businesses. On the other hand, if a filter is too accurate, it can result in a lot of false positives..

3. Spammers are constantly coming up with new techniques to bypass spam filters, and this means that filters need to be updated and adapted to keep up. This can be a time-consuming and challenging process.

2

Brainstorm

Ideas For Optimizing Spam Filtering

Person 1

Adding a CAPTCHA to the email submission form can help prevent bots from sending spam emails

Require users to confirm their email address before sending an email. This can help prevent spam from being sent from fake or invalid email addresses

Create a list of common keywords and phrases found in spam emails and use them to filter incoming emails

Person 2

Some spam emails have fake message headers. Check the message headers for inconsistencies or abnormalities to identify spam emails

Assign a score to each incoming email based on its content, sender, and other factors. Set a threshold score to automatically mark emails as spam

Educate users about how to recognize and report spam emails. This can help reduce the amount of spam received and improve the effectiveness of filtering.

Person 3

Many tools and techniques are offered by companies inorder to detect spam emails in a network.

Don't open unknow number or unknow email

Person 4

Most email clients and email service providers have built-in spam filters that you can turn on to help filter out unwanted messages.

Avoid clicking on links in emails from unknown senders or those that look suspicious.
